Full Stack Software Engineer & B2B Consultant

Professional Summary

My journey in tech started as an apprentice, writing Excel VBA to automate manual processes — and I was hooked on problem-solving. That early passion led me to a degree in Software Engineering and a career architecting complex, scalable corporate solutions. Today, I act as a B2B Consultant and Senior Engineer, drawing on a robust, polyglot stack to build software that delivers real business value. I have a strong DevSecOps mindset (Secure by Design), ensuring that vulnerability prevention and high performance are the foundation of everything I build, from backend microservices to AI-assisted architectures.

Experience

Helisul Aviation Dec/2022 – Dec/2025

Mid-level Tech Analyst

- Designed and implemented a digital inventory counting application that eliminated manual, paper-based processes and reduced counting time by enabling the supply team to perform real-time updates directly from tablets. The solution integrated seamlessly with the company's ERP, improving data accuracy and streamlining accounting workflows.
- Developed a structured backend repo using Node to centralize company endpoints and requests, also configurating Firewall access rules for security and documented with Swagger.
- Automated the end-to-end recruitment, hiring, and onboarding workflow, leveraging AI APIs for candidate application analysis, automated system access provisioning, and cross-department integrations — significantly improving efficiency and the overall onboarding experience for new employees.
- Authored technical documentation using Swagger and UML, delivering clear, standardized references for APIs and system architecture.
- Managed version control with Git/GitHub with semantic commits, ensuring code integrity, enabling efficient change tracking, and enhancing cross-team collaboration.
- Maintained, enhanced, refactored and optimized innumerous legacy applications, ensuring stability and extending system lifecycle.

Senior Software Engineer / Independent B2B Consultant Dec/2025 – Today

I work as a Software Engineer and B2B Consultant, architecting and developing scalable, secure, and process-oriented solutions. I have a strong DevSecOps mindset (Secure by Design), ensuring that vulnerability prevention is the foundation of the entire development and engineering lifecycle.

- **Backend Engineering:** Development and maintenance of high-performance microservices using Java 17 (Spring Boot, Security, Data JPA), C# (.NET Core), and Node.js.
- **Frontend Development:** Design and implementation of user interfaces and forms using jQuery and Bootstrap, alongside experience with TypeScript and AngularJS.
- **Architecture & Innovation:** Design of complex architectures, including the creation of AI-assisted assessment and feedback systems.
- **DevOps & Cloud:** Resource management on Google Cloud Platform (GCP) and construction of end-to-end CI/CD pipelines using Jenkins for 100% automated deployments.
- **Integration & Processes:** Messaging orchestration with RabbitMQ and requirements/process engineering (BPM) applied on the TOTVS Fluig platform.
- **Data Persistence:** Modeling, administration, and optimization of relational (MSSQL, MySQL, Oracle) and non-relational (MongoDB) databases.
- **Agile Culture & Quality:** Working within the Scrum framework, version control (Git/Bitbucket), and conducting rigorous code reviews to ensure technical excellence.

Education

Bachelor's from Cesumar University of Curitiba 2022 - 2025
Software Engineering *Curitiba – PR*

Alura Technology School
JavaScript for Web Development Projects
Node.js and React.js
JavaScript for Backend
Git and GitHub

Rocketseat
Java Fundamentals

Skills

Backend & Architecture: Java 17 (Spring Boot/Security), C# (.NET Core), Node.js, Microservices, Clean Architecture, System Integrations, AI-assisted Solutions.
Frontend: JavaScript/TypeScript, AngularJS, jQuery, Bootstrap.
DevOps & Cloud: Google Cloud Platform (GCP), CI/CD (Jenkins), DevSecOps.
Data & Messaging: RabbitMQ, SQL Server, MySQL, Oracle, MongoDB.
Processes & Culture: BPM / TOTVS Fluig, Scrum, Agile Methodologies.

Relevant Personal Projects

CaseCobra – Custom iPhone case SaaS

GitHub Repo | Demo Link

Designed, built, and deployed a SaaS platform for custom cellphone cases, focusing on a seamless user experience with modern UI components and smooth animations. The platform includes secure authentication, email verification, and Stripe-based payment processing, ensuring a reliable and scalable customer journey. Additionally, I developed an admin dashboard that supports order management, product customization, and secure role-based access, giving the application a complete end-to-end structure.

House Cleaning Scheduling Application (In Progress)

Frontend Repo | Backend Repo

Currently developing a full-stack web application that allows users to schedule house-cleaning services with role-based access for admins, cleaners, and clients. The backend was structured with Nest.js, Prisma, and PostgreSQL, and fully documented with Swagger for clarity and maintainability. Secure JWT authentication and user management have already been implemented, while the frontend, built with Next.js and Tailwind, delivers a responsive landing page and sets the foundation for future features such as scheduling, payments, and notifications.
